Custom Properties and Nesting Report

Helga Gaona 26 September 2026

Site Details

My live ward activity board is at https://helgagaona.github.io/wdd331-portfolio/unit-1/custom-properties/index.html and the source code is at https://github.com/helgagaona/wdd331-portfolio.git.

Reflections

You wrote all of your CSS using native nesting. Compare the experience to writing flat, non-nested CSS. Where did nesting make your stylesheet clearer, and was there a point where it started to feel like too much? How would you decide where to stop nesting in a larger project?

Writing nested CSS made the stylesheet clearer and more organized. Related styles stay together under their parent instead of interfering with the whole file, this way is easy to see at glance what is affecting what. It started to feel like too much whenever I thought of adding a third level because it was annoying to read and they were being too specific and overriding the styles would've gotten harder if I kept going. In a larger project I won't nest more than two levels and will use nesting more for grouping a component with states and variants rather than mirroring the entire HTML structure.

Your stylesheet derives values from tokens using `calc()` and `clamp()`. Pick one of those derived values and explain what would happen if you changed the base token it depends on. How many places in your stylesheet would be affected, and why does that matter on a team?

--spacing-card-gap uses calc(var(--spacing-sm) * 2) currently being 1rem. If --spacing-sm changed from 0.5rem to 0.75 rem, the .cards grid gap would become 1.5 rem.

If changed, it would affect 3 other places, the header text, card titles, and card details. One token is so helpful to keep any change consistent across the elements that contain that custom style.

Look at your finished ward activity board at a narrow mobile width and a wide desktop width. Describe one specific thing that `clamp()` or your responsive layout handled automatically that would have required a media query in traditional CSS:

It's amazing what clamp did without using media queries. The .card grid handles the width automatically. On a narrow phone, the cards stack in one column, on a large screen the cards will fit side by side.
